Clinical Image

In the year 2012, one 36 years old female presented with severe spontaneous pain in vagina and lesions on vulva. Macroscopic and under colposcopy I found white, solid, hard, round, painful and easy bleeding lesions on board with healthy tissue. Biopsy result was Mucosis manifestation of antibody reaction full of leukocyte, Papanikolau test then was III.

For 3-4 days pain and others symptoms disappeared without any treatment. I thought that it could be Linear IgA disease. After few months I took again Papanikolau test and was II.

3 years after this lesions in genital region, start to show up new lesions in mouth and esophagus with oral disorders. Lesions looks like aphta. They are often, painful, rounds. After exams, rheumatologist gave her another drug "Morbus Behcet". Her gynecological status now is in order **Figure 1,2,3,4,5**.

Figure 1 Macroscopic and under colposcopy found white, solid, hard, round, painful and easy bleeding lesions on board with healthy tissue.

Figure 2 Biopsy result was Mucosis manifestation of antibody reaction full of leukocyte.
