## Abstract

Musculocutaneous neuropathy (MCNP) is one of the fringe neuropathies that happen in the furthest points. By and large, disengaged MCNP is an interesting fringe nerve neuropathy. Most cases revealed in the writing have been sports-related wounds, for example, power lifting, resistive activity, paddling, football tossing, sports-related injury, swimming, tennis, racquetball, wind-surfing, drop in an upward air stream, and other exhausting games. As indicated by different reports, MCNP can be incited by cast situation, shoulder separation, clavicular cracks, injury during shoulder a medical procedure, and intraoperative arm malpositioning [1]. Be that as it may, the components of disconnected MCNP are not totally perceived. There were just barely any past reports of disconnected MCNP following spine medical procedure. Here, we report an interesting instance of confined MCNP after thoracolumbar spine medical procedure under inclined position. A 58-year-old male gripped of serious low back torment related with thoracolumbar disfigurement.
